

Small geared motors up to 550 W

This gear series includes one and two-stage worm gears, cylindrical gears with worm preceding stage as well as two- and three-stage cylindrical gears.

All gears can be standard equipped with three-phase, one-phase, D.C.-bypass or permanent magnet motors.

The same model range is available – except the cylindrical gear with worm preceding stage – also with free drive-in shaft.

The housings are made of an aluminium alloy.

All shafts are carried in ball-bearings.

The internal parts are highly precise processed and all types can be delivered on request with base plates, flanges or threaded holes on all faces (except the driving side).

The gears are completely closed (without lubrication fittings) and can be used in any installation position.

Permitted temperature range: -15°C up to +40°C

The gears are life-time lubricated with a synthetic fluid grease.
